

CASE STUDY

Towing – Roll Back

Challenge: Our customer installed their hydraulic hoses and fittings under the truck after the control manifolds were fixed into position. Working under the chassis made it very unproductive and sometimes dangerous.

Solution: The rear hydraulic system was isolated and placed on a removable framework thus allowing most of the assembly to be done on the bench. Tubes assemblies were routed to precisely where the ends could mate with adapters.

Benefits: Safety during install

Lower cost of labor in production

Ease of maintenance / Durability
